Normalisation

Normalisation: branch of relational theory providing design insights.

The goals of normalisation:

- be able to characterise the level of redundancy in a relational schema
- provide mechanisms for transforming schemas to remove redundancy

Normalisation draws heavily on the theory of functional dependencies.

Normalisation algorithms reduce the amount of redundancy in a schema

 by decomposition (break schema into connected pieces)

COMP3311 21T1 ♦ Normal Forms ♦ [1/10]

Normal Forms

Normalisation theory defines six normal forms (NFs).

- First,Second,Third Normal Forms (1NF,2NF,3NF) (Codd 1972)
- Boyce-Codd Normal Form (BCNF) (1974)
- Fourth Normal Form (4NF) (Zaniolo 1976, Fagin 1977)
- Fifth Normal Form (5NF) (Fagin 1979)

We say that "a schema is in xNF", which ...

 tells us something about the level of redundancy in the schema

1NF allows most redundancy; 5NF allows least redundancy.

For most practical purposes, BCNF (or 3NF) are acceptable NFs.

COMP3311 21T1 ♦ Normal Forms ♦ [2/10]

❖ Normal Forms (cont)

1NF all attributes have atomic values

we assume this as part of relational

model,

so every relation schema is in 1NF

2NF all non-key attributes fully depend

on key

(i.e. no partial dependencies)

avoids much redundancy

3NF no attributes dependent on non-key

BCNF attrs

(i.e. no transitive dependencies)

avoids most remaining redundancy

COMP3311 21T1 ♦ Normal Forms ♦ [3/10]

❖ Normal Forms (cont)

In practice, BCNF and 3NF are the most important.

Boyce-Codd Normal Form (BCNF):

- eliminates all redundancy due to functional dependencies
- but may not preserve original functional dependencies

Third Normal Form (3NF):

- eliminates most (but not all) redundancy due to fds
- guaranteed to preserve all functional dependencies

COMP3311 21T1 ♦ Normal Forms ♦ [4/10]

Boyce-Codd Normal Form

A relation schema *R* is in BCNF w.r.t a set *F* of functional dependencies iff:

for all $fds X \rightarrow Y$ in F^+

- either $X \rightarrow Y$ is trivial (i.e. $Y \subset X$)
- or X is a superkey (i.e. non-strict superset of attributes in key)

A DB schema is in BCNF if all of its relation schemas are in BCNF.

Observations:

- any two-attribute relation is in BCNF
- any relation with key K, other attributes Y, and $K \rightarrow Y$ is in BCNF

COMP3311 21T1 ♦ Normal Forms ♦ [5/10]

Boyce-Codd Normal Form (cont)

If we transform a schema into BCNF, we are guaranteed:

- no update anomalies due to fd-based redundancy
- lossless join decomposition

However, we are not guaranteed:

the new schema preserves all fds from the original schema

This may be a problem if the *fd*s contain significant semantic information about the problem domain (use 3NF to preserve dependencies)

A dependency $A \rightarrow C$ is not preserved if, e.g.

- X = ABC and ABC are all in relation R
- after decomposition into S and T, AB is in S and BC is in T

COMP3311 21T1 ♦ Normal Forms ♦ [6/10]

Boyce-Codd Normal Form (cont)

Example: schema in BCNF

$$R = ABCD, F = \{A \rightarrow B, A \rightarrow C, A \rightarrow D\}$$

key(R) = A, all fds have key on RHS

Example: schema not in BCNF

$$R = ABCD, F = \{A \rightarrow BCD, D \rightarrow B, BC \rightarrow AD\}$$

if key(R) = A, $D \rightarrow B$ does not have key on LHS

if key(R) = BC, $D \rightarrow B$ does not have key on LHS

COMP3311 21T1 ♦ Normal Forms ♦ [7/10]

<< \ \ >:

Third Normal Form

A relation schema *R* is in 3NF w.r.t a set *F* of functional dependencies iff:

for all $fds X \rightarrow Y$ in F^+

- either $X \rightarrow Y$ is trivial (i.e. $Y \subset X$)
- or X is a superkey
- or Y is a single attribute from a key

A DB schema is in 3NF if all relation schemas are in 3NF.

The extra condition represents a slight weakening of BCNF requirements.

COMP3311 21T1 ♦ Normal Forms ♦ [8/10]

Third Normal Form (cont)

If we transform a schema into 3NF, we are guaranteed:

- lossless join decomposition
- the new schema preserves all of the *fd*s from the original schema

However, we are not guaranteed:

no update anomalies due to fd-based redundancy

Whether to use BCNF or 3NF depends on overall design considerations.

COMP3311 21T1 ♦ Normal Forms ♦ [9/10]

< ,

Third Normal Form (cont)

Example: schema in 3NF

$$R = ABCDE, F = \{B \rightarrow ACDE, E \rightarrow B\}$$

key(R) = B, in $E \rightarrow B$, E is not a key, but B is

Example: schema not in 3NF

$$R = ABCDE, F = \{B \rightarrow ACDE, E \rightarrow D\}$$

key(R) = B, in $E \rightarrow D$, E is not a key, neither is D
